1

OSPF

- Open Shortest
 Path First
- Link state or SPF technology
- Developed by OSPF working group of IETF (RFC 1247)
- Designed for TCP/IP Internet environment
- Fast convergence

- Variable-length subnet masks
- Discontiguous subnets
- No periodic updates
- Route authentication
- OSPF standard described in RFC2328

Link State

Link State Routing

- Neighbour discovery
- Constructing a Link State Packet (LSP)
- Distribute the LSP

(Link State Announcement – LSA)

- Compute routes
- On network failure

New LSPs flooded

All routers recompute routing tables

Low Bandwidth Utilisation

- Only changes propagated
- Multicast on multi-access broadcast networks

Fast Convergence

Detection Plus LSA/SPF

Fast Convergence

- Finding a new route
 - LSA flooded throughout area
 - **Acknowledgement based**
 - **Topology database synchronised**
 - Each router derives routing table to destination networks

IP Multicast for Sending/Receiving Updates

Broadcast networks

All routers must accept packets sent to AllSPFRouters (224.0.0.5)

All DR and BDR routers must accept packets sent to AllDRouters (224.0.0.6)

 Hello packets sent to AllSPFRouters (Unicast on point-to-point and virtual links)

OSPF Areas

Invisible outside the area

Reduction in routing traffic

Backbone area contiguous

All other areas must be connected to the backbone

Virtual Links

Classification of Routers

OSPF Route Types

Inter-Area Route Summarisation

Cisco ISP Workshops

External Routes

- Prefixes which are redistributed into OSPF from other protocols
- Flooded unaltered throughout the AS
- OSPF supports two types of external metrics

Type 1 external metrics

Type 2 external metrics (Default)

External Routes

 Type 1 external metric: metrics are added to the summarised internal link cost

2007 Cisco Systems, Inc. All rights reserved.

External Routes

 Type 2 external metric: metrics are compared without adding to the internal link cost

2007 Cisco Systems, Inc. All rights reserved.

Topology/Link State Database

- A router has a separate LS database for each area to which it belongs
- All routers belonging to the same area have identical database
- SPF calculation is performed separately for each area
- LSA flooding is bounded by area

Protocol Functionality

- Bringing up adjacencies
- LSA types
- Area classification

The Hello Protocol

- Responsible for establishing and maintaining neighbour relationships
- Elects designated router on multi-access networks

The Hello Packet

- Router priority
- Hello interval
- Router dead interval
- Network mask
- Options: T-bit, E-bit
- List of neighbours

Designated Router

There is ONE designated router per multi-access network

Generates network link advertisements

Assists in database synchronization

Designated Router by Priority

- Configured priority (per interface)
- Else determined by highest router ID

Router ID is the loopback interface address, if configured, otherwise the highest IP address

144.254.3.5

Neighbouring States

• Full

Routers are fully adjacent Databases synchronised Relationship to DR and BDR

Neighbouring States

• 2-way

Router sees itself in other Hello packets DR selected from neighbours in state 2-way or greater

When to Become Adjacent

- Underlying network is point to point
- Underlying network type is virtual link
- The router itself is the designated router
- The router itself is the backup designated router
- The neighbouring router is the designated router
- The neighbouring router is the backup designated router

LSAs Propagate Along Adjacencies

LSAs acknowledged along adjacencies

Routing Protocol Packets

- Share a common protocol header
- Routing protocol packets are sent with type of service (TOS) of 0
- Five types of OSPF routing protocol packets
 - Hello packet type 1
 - **Database description packet type 2**
 - Link-state request packet type 3
 - Link-state update packet type 4
 - Link-state acknowledgement packet type 5

Different Types of LSAs

Four distinct type of LSAs

Type 1 : Router LSA

Type 2 : Network LSA

Type 3 and 4: Summary LSA

Type 5 and 7: External LSA

Router LSA (Type 1)

- Describes the state and cost of the router's links to the area
- All of the router's links in an area must be described in a single LSA
- Flooded throughout the particular area and no more
- Router indicates whether it is an ASBR, ABR, or end point of virtual link

Network LSA (Type 2)

- Generated for every transit broadcast and NBMA network
- Describes all the routers attached to the network
- Only the designated router originates this LSA
- Flooded throughout the area and no more

Summary LSA (Type 3 and 4)

- Describes the destination outside the area but still in the AS
- Flooded throughout a single area
- Originated by an ABR
- Only inter-area routes are advertised into the backbone
- Type 4 is the information about the ASBR

External LSA (Type 5 and 7)

- Defines routes to destination external to the AS
- Default route is also sent as external
- Two types of external LSA:
 - E1: Consider the total cost up to the external destination

E2: Considers only the cost of the outgoing interface to the external destination

 (Type 7 LSAs used to describe external LSA for one specific OSPF area type)

No Summarisation

- Specific Link LSA advertised out of each area
- Link state changes propagated out of each area

With Summarisation

- Only summary LSA advertised out of each area
- Link state changes do not propagate out of the area

No Summarisation

- Specific Link LSA advertised in to each area
- Link state changes propagated in to each area

With Summarisation

- Only summary link LSA advertised in to each area
- Link state changes do not propagate in to each area

Types of Areas

- Regular
- Stub
- Totally Stubby
- Not-So-Stubby

Regular Area (Not a Stub)

• From Area 1's point of view, summary networks from other areas are injected as are external networks such as X.1

Normal Stub Area

- Summary networks, default route injected •
- Command is area x stub •

Totally Stubby Area

- Only a default route injected
 Default path to closest area border router
- Command is area x stub no-summary

Not-So-Stubby Area

- Capable of importing routes in a limited fashion
- Type-7 LSA's carry external information within an NSSA
- NSSA Border routers translate selected type-7 LSAs into type-5 external network LSAs
 ASBR

Addressing for Areas

Assign contiguous ranges of subnets per area to facilitate summarisation

Summary

Scalable OSPF Network Design

Area hierarchy

Stub areas

Contiguous addressing

Route summarisation
